## Practical Siemens PLC Programming Examples

To illustrate the versatility of Siemens PLCs, here are several real-world programming examples, each demonstrating different control techniques and application scenarios.

### - Basic On/Off Control Using Ladder Logic

Scenario: Control a motor with start and stop push buttons.

Objective: When the 'Start' button is pressed, the motor turns on; pressing 'Stop' de-energizes it.

Implementation:

- Use a latching (seal-in) circuit to keep the motor running after the start button is released.
- Use contacts representing physical push buttons and relay coils.

Sample Ladder Logic:

...

```
|---[Start]---+---[Motor]---+---(Seal-In)---
```

```
| | |
```

```
| +---[Stop]-----+
```

...

- Start Button (Normally Open): When pressed, energizes the motor coil.
- Motor Coil: Activates the motor output.
- Seal-In Contact: Maintains the motor ON state until Stop is pressed.
- Stop Button (Normally Closed): When pressed, breaks the circuit, turning off the motor.

Code Summary:

```
```ladder
```

```
// Rung 1: Start/Stop Control
```

```
|--[Start]---+---(Motor)---+---[Seal-In]--|
```

```
|||
```

```
| +--[Stop]-----+
```

```
```
```

Key Concepts:

- Maintaining system state with seal-in contacts.
- Using physical inputs as contacts.
- Basic understanding of ladder rungs and coil activation.

- Temperature Monitoring and Control

Scenario: Maintain a process temperature within a specified range.

Objective: Turn on a heater when temperature drops below a set point; turn it off when it exceeds an upper limit.

Implementation:

- Read temperature sensor input via analog input module.
- Use a structured text program to evaluate the temperature and control the heater.

Sample Structured Text Code:

```
```pascal
```

```
IF Temperature
```

```
Heater := TRUE; // Turn on heater
```

```
ELSIF Temperature > UpperLimit THEN
```

```
Heater := FALSE; // Turn off heater
```

```
END_IF;
```

```
...
```

Additional Considerations:

- Implement hysteresis to prevent rapid switching.
- Incorporate delay timers for smooth control.
- Use PID control blocks for advanced regulation.

Benefits of Using Structured Text:

- Clear logic for complex control.
- Easier to implement algorithms like PID.

- Counting Items on a Conveyor Belt

Scenario: Count the number of objects passing a sensor.

Objective: Increment a counter each time a sensor detects an item, and trigger an alert when a target count is reached.

Implementation:

- Use a digital input from an optical or proximity sensor.
- Employ a rising edge detection to count each passing object accurately.
- Use a counter function block for counting.

Sample Ladder Logic with Counter:

```
...
```

```
|---[Sensor]---+---[Rising Edge Detection]---+---(Counter)---|
```

```
...
```

Using Siemens Function Block (FB):

```
``pascal
```

```
// Rung for rising edge detection
```

```
EdgeDetect(IN := SensorInput, Q => SensorRisingEdge);
```

```
// Counter block
```

```
Counter(CU := SensorRisingEdge, PV := TargetCount, Q => CountReached);
```

```
// When CountReached is TRUE, trigger an alarm
```

```
IF CountReached THEN
```

```
Alarm := TRUE;
```

```
END_IF;
```

```
``
```

Advantages:

- Accurate counting with edge detection.
- Flexibility for changing target counts.
- Easy integration with alarms and notifications.

- Motor Speed Control with Pulse Width Modulation (PWM)

Scenario: Control a DC motor's speed precisely.

Objective: Adjust motor speed based on a user input or process requirement.

Implementation:

- Generate PWM signals via Siemens PLC outputs.
- Use high-speed counters and timers for accurate pulse generation.

- Adjust duty cycle for speed control.

Sample Approach:

- Use a Structured Text program to vary duty cycle:

```
``pascal
```

```
// Define desired speed as percentage
```

```
DesiredSpeed := 70; // 70%
```

```
// Calculate timer on/off durations
```

```
OnTime := (DesiredSpeed / 100.0) CycleTime;
```

```
OffTime := CycleTime - OnTime;
```

```
// Generate PWM signal
```

```
IF Timer
```

```
PWM_Output := TRUE;
```

```
ELSE
```

```
PWM_Output := FALSE;
```

```
END_IF;
```

```
// Reset timer
```

```
IF Timer >= CycleTime THEN
```

```
Timer := 0;
```

```
ELSE
```

```
Timer := Timer + CycleTimeStep;
```

```
END_IF;
```

...

Implementation Notes:

- Use high-speed counters and timers.
- Ensure safe operation when controlling motor power.
