- The operculum protects the gills and aids in water flow regulation.

Digestive System

- Processes food to extract nutrients.
- The liver produces bile to aid in digestion.
- The pancreas secretes enzymes for breaking down food.

Excretory System

- The kidneys filter waste products from blood.
- The cloaca serves as a common chamber for excretion and reproductive discharge.

Reproductive System

- Fish reproduce via external fertilization.
- Gonads develop eggs or sperm that are released into the water.

Common Questions and Their Answers (Based on Biology Junction Dissection Key)

- Q: How can you distinguish male from female perch?

A: Males typically have smaller, threadlike testes, while females have larger, yolk-filled ovaries containing eggs.

- Q: What is the function of the swim bladder?

A: It helps the fish control buoyancy, allowing it to remain at desired water depths.

- Q: Why are the gills located beneath the operculum?

A: The operculum covers and protects the delicate gill filaments while aiding in water movement over the gills during respiration.
