Accurate impressions are critical for a successful restoration. The dentist captures the patient's dental arches using materials like silicone or polyether. These impressions are then sent to the lab.

Model Creation

The impressions are poured with dental stone to produce precise physical models, which serve as the foundation for further procedures. Alternatively, digital impressions obtained via intraoral scanners can be directly imported into CAD/CAM software, streamlining the process.

Digital Workflow and CAD/CAM Integration

Designing with Digital Tools

Many modern dental labs, including Rudd Morrow, utilize computer-aided design and manufacturing (CAD/CAM) technology. The steps include:

- Importing digital impressions or scans into CAD software
- Designing restorations with precise control over anatomy, contacts, and occlusion
- Simulating the final appearance and fit of the prosthetic

Fabrication via CAM Technology

Once the design is finalized, the file is sent to CNC milling machines or 3D printers:

- Choosing the appropriate material (ceramics, resins, metals)
- Carving or printing the restoration with high precision
- Performing post-processing steps like sintering or glazing

Material Selection and Processing

Types of Materials Used

The choice of material depends on the type of restoration, aesthetic requirements, and functional demands. Common materials include:

- Porcelain and ceramic composites for crowns and veneers
- Metal alloys such as gold, palladium, or nickel-chromium for frameworks
- Resin-based materials for provisional restorations

- High-strength zirconia for durable crowns and bridges

Processing Techniques

After fabrication, restorations undergo several processing steps:

Firing and Sintering Ceramic restorations are fired in kilns to achieve optimal strength and aesthetic properties.
Glazing and Polishing Applying glaze enhances esthetics and smoothness, improving both appearance and longevity.
Try-in and Adjustments The dentist evaluates the restoration in the patient's mouth, making necessary adjustments for fit and occlusion.

Final Fitting and Delivery

Seating the Restoration

The dentist seats the restoration, ensuring proper fit, contact points, and aesthetics. The lab provides guidance on any modifications needed.

Bonding and Cementation

Using appropriate dental cements or adhesives, the dentist permanently affixes the restoration. Proper curing and finishing ensure durability.

Post-Placement Care

Patients are advised on maintenance routines to preserve their restorations, including oral hygiene practices and regular check-ups.

Core Components of an LCD Display

Understanding the fundamental components of an LCD is the first step toward mastering its operation and maintenance. Damon Morrow's guide provides an exhaustive breakdown, covering:

1. Liquid Crystal Layer

- Acts as the core medium that modulates light to produce images.
- Composed of nematic liquid crystals whose orientation can be controlled via electric fields.
- Responsible for controlling the passage of light through the display.

2. Backlight System

- Typically uses LED technology for illumination.
- Provides the necessary light source since LCDs are transmissive displays.
- Variations include edge-lit and direct-lit backlights, each with specific characteristics.

3. Polarizers

- Two polarizer panels are positioned at right angles.
- Control the polarization state of light passing through the liquid crystal layer.
- Critical for image formation.

4. Color Filters

- Comprise red, green, and blue filters.
- Layered over the liquid crystal to produce a full spectrum of colors.
- Quality of color filters impacts color accuracy and vibrancy.

5. Glass Substrates

- Support the liquid crystal layer.
