A 50.0 L sample of nitrogen gas (N₂) is collected at STP.

Question:

How many moles of N₂ are present?

Solution:

Using molar volume at STP: 1 mol N₂ = 22.4 L

\[

$$\text{Moles of N}_2 = \frac{\text{Volume}}{\text{Molar volume}} = \frac{50.0 \text{ L}}{22.4 \text{ L/mol}} \approx 2.23 \text{ mol}$$

\]

Problem 2: Determining Volume of Gas from Moles

Given:

You have 3.00 mol of hydrogen gas (H₂).

Question:

What volume does this gas occupy at STP?

Solution:

\[

$$\text{Volume} = \text{Moles} \times \text{Molar volume} = 3.00 \text{ mol} \times 22.4 \text{ L/mol} = 67.2 \text{ L}$$

\]

Problem 3: Gas Stoichiometry in a Reaction

Given:

When 10.0 L of hydrogen gas reacts with excess oxygen, how many liters of water vapor (H₂O) are produced at STP?

Reaction:

\[

\]

Solution:

- First, determine moles of H₂:

\[

$$\frac{10.0 \text{ L}}{22.4 \text{ L/mol}} \approx 0.446 \text{ mol}$$

\]

- From the balanced equation, 2 mol H₂ produce 2 mol H₂O, so the molar ratio is 1:1.

- Moles of H₂O produced: 0.446 mol

- Volume of H₂O vapor at STP:

$$0.446 \text{ mol} \times 22.4 \text{ L/mol} \approx 10.0 \text{ L}$$

Answer: Approximately 10.0 liters of water vapor are produced.

What is Stoichiometry?

Definition of Stoichiometry

Stoichiometry is the branch of chemistry that deals with the quantitative relationships between reactants and products in a chemical reaction. It enables chemists to predict how much of each substance is involved in a reaction based on the balanced chemical equation.

Importance of Stoichiometry

- Ensures proper reagent quantities in laboratory experiments
- Optimizes chemical manufacturing processes
- Helps in calculating yields and efficiencies
- Fundamental for understanding mole relationships

Core Concepts in Chemistry Stoichiometry

Mole Concept

The mole is the fundamental unit in chemistry used to count particles (atoms, molecules, ions). Key points include:

- 1 mole = 6.022×10^{23} particles (Avogadro's number)
- Molar mass (g/mol): mass of one mole of a substance

Balanced Chemical Equations

A balanced chemical equation accurately reflects the conservation of mass, with equal numbers of atoms for each element on both sides.

Reaction Types

- Combustion
- Synthesis
- Decomposition
- Single replacement
- Double replacement

Understanding these helps in applying specific stoichiometric calculations.

Step-by-Step Stoichiometry Calculation Process

- Write and balance the chemical equation.
- Convert given quantities to moles.
- Use mole ratios from the balanced equation to find the moles of desired substances.
- Convert moles back to grams, liters (for gases), or molecules as needed.

Key Formulas and Conversion Factors

Mole Conversions

- Mass to moles:

$$\text{Moles} = \frac{\text{Mass (g)}}{\text{Molar mass (g/mol)}}$$

- Moles to mass:

$$\text{Mass (g)} = \text{Moles} \times \text{Molar mass (g/mol)}$$

- Mole to molecules:

$$\text{Number of molecules} = \text{Moles} \times 6.022 \times 10^{23}$$

- Mole to atoms/ions:

$$\text{Number of atoms/ions} = \text{Moles} \times 6.022 \times 10^{23}$$

Gas Volume at STP (Standard Temperature and Pressure)

- 1 mole of gas = 22.4 liters

Percent Composition

$$\% \text{Element} = \left(\frac{\text{Mass of element in compound}}{\text{Molar mass of compound}} \right) \times 100$$

Common Stoichiometry Problems and Solutions

- Calculating the Mass of Product Formed

Example:

Given 10 g of hydrogen gas reacting with excess oxygen, find the mass of water produced.

Solution:

- Write the balanced equation:

- Convert grams of H₂ to moles:

$$\frac{10\text{ g}}{2.016\text{ g/mol}} \approx 4.96\text{ mol}$$

- Use the mole ratio (from the equation):

- Moles of H₂O produced:

$$4.96\text{ mol H}_2\text{O}$$

- Convert to grams:

$$[4.96, \text{mol}] \times 18.015, \text{g/mol} \approx 89.5, \text{g}]$$

- Limiting Reactant Identification

Example:

Given 5 g of aluminum and 10 g of chlorine gas, determine the limiting reactant.

Solution:

- Convert masses to moles:

$$[\text{Al: } \frac{5, \text{g}}{26.98, \text{g/mol}} \approx 0.185, \text{mol}]$$

$$[\text{Cl}_2: \frac{10, \text{g}}{70.906, \text{g/mol}} \approx 0.141, \text{mol}]$$

- Balanced equation:

- Mole ratio:

$$[2, \text{mol Al} : 3, \text{mol Cl}_2]$$

- Find the amount of Cl₂ needed for 0.185 mol Al:

$$[\frac{3}{2} \times 0.185 \approx 0.278, \text{mol}]$$

- Since only 0.141 mol Cl₂ is available, Cl₂ is limiting.

Tips for Effective Stoichiometry Calculations

- Always balance your chemical equation first.

Question 2: Calculate the moles of CO_2 produced when 5 grams of propane (C_3H_8) undergo complete combustion.

Answer:

- Molar mass of $\text{C}_3\text{H}_8 = (3 \times 12.01) + (8 \times 1.008) = 44.11 \text{ g/mol}$

- Moles of $C_2H_2 = 5 \text{ g} / 44.11 \text{ g/mol} = 0.113 \text{ mol}$
- From the balanced equation: $C_2H_2 + 5O_2 \rightarrow 3CO_2 + 4H_2O$
- 1 mol C_2H_2 produces 3 mol CO_2
- Moles of $CO_2 = 0.113 \text{ mol} \times 3 = 0.339 \text{ mol}$
