Detailed Breakdown of Chapter 6.5 Components

Solving Multi-Step Equations

Multi-step equations often involve a combination of operations that must be carefully unraveled. The typical process includes:

- Simplify each side of the equation: Use the distributive property to expand expressions and combine like terms.
- Isolate the variable term: Use addition or subtraction to move constants to the other side.
- Eliminate coefficients: Divide both sides by the coefficient to solve for the variable.
- Check the solution: Substitute the found value back into the original equation to verify correctness.

Example:

Solve $3(x + 4) - 2 = 11$

Step-by-step solution:

- Distribute: $3x + 12 - 2 = 11$
- Combine like terms: $3x + 10 = 11$
- Subtract 10 from both sides: $3x = 1$
- Divide both sides by 3: $x = \frac{1}{3}$
- Verify: $3\left(\frac{1}{3} + 4\right) - 2 = 11$

Properties of Equality and Their Application

Understanding the properties that justify each step in solving equations is crucial:

- Addition Property: Adding the same number to both sides of an equation maintains equality.
- Subtraction Property: Subtracting the same number from both sides preserves equality.
- Multiplication Property: Multiplying both sides by the same non-zero number keeps the equation balanced.
- Division Property: Dividing both sides by a non-zero number maintains equality.

These properties serve as the backbone for algebraic manipulations. Students should practice using these properties to build confidence in solving equations systematically.

Distributive Property and Combining Like Terms

Mastery of the distributive property is vital for expanding expressions and simplifying equations:

- Distributive Property: $a(b + c) = ab + ac$
- Combining Like Terms: Simplify expressions by adding or subtracting similar terms, e.g., $(3x + 2x = 5x)$

Application in equations:

- Expand expressions with parentheses.
- Simplify complex equations before isolating the variable.

Word Problems and Algebraic Modeling

Translating word problems into algebraic equations involves:

- Identifying the unknown quantities.
- Assigning variables.
- Writing equations based on the relationships described.

Example:

A rectangle has a length that is 3 meters longer than its width. If the perimeter is 26 meters, find the dimensions.

Solution:

- Let w be the width.
- Then, length $l = w + 3$.
- Perimeter $P = 2l + 2w$, so $2(w + 3) + 2w = 26$.
- Simplify: $2w + 6 + 2w = 26$? $4w + 6 = 26$.
- Solve: $4w = 20$? $w = 5$.
- Find length: $l = 5 + 3 = 8$.

This example illustrates the importance of translating real-world scenarios into algebraic expressions and solving systematically.
