Sample Questions from the June 13 Paper and Model Answers

To illustrate the types of questions and expected responses, here are sample questions along with brief model answers:

Sample Question 1: Short Answer

Question: Describe the role of the Golgi apparatus in cells.

Answer: The Golgi apparatus modifies, sorts, and packages proteins and lipids received from the endoplasmic reticulum. It is involved in processing molecules for secretion or for use within the cell and forms vesicles for transport.

Sample Question 2: Data Interpretation

Question: The graph shows the rate of photosynthesis at different light intensities. Describe the trend and explain why the rate plateaus at higher light intensities.

Answer: The graph indicates that as light intensity increases, the rate of photosynthesis also increases until it reaches a plateau. This occurs because, beyond a certain light intensity, other factors such as CO₂ concentration or temperature become limiting, preventing further increases in the rate.

Sample Question 3: Extended Response

Question: Explain the importance of genetic variation within a population for evolution.

Answer: Genetic variation provides a range of different alleles in a population, some of which may confer advantages in survival or reproduction. This variation allows natural selection to act upon these traits, leading to evolution over time as favorable traits become more common.

Sample Question Analysis and Model Answers

To illustrate the depth and style of questions in the 2013 F214 paper, let's analyze a typical question and its ideal approach.

Sample Question:

"A student investigates the effect of temperature on enzyme activity by measuring the breakdown of starch by amylase at different temperatures. The student records the time taken for the solution to turn clear at each temperature. Explain how temperature affects enzyme activity and interpret the following results: at 20°C, the reaction takes 5 minutes; at 40°C, it takes 2 minutes; at 60°C, it takes 10 minutes."

Model Answer:

Temperature influences enzyme activity primarily through its effect on molecular kinetics and enzyme structure. As temperature increases from 20°C to 40°C, enzyme molecules gain kinetic energy, leading to more frequent collisions with substrate molecules, thus increasing the rate of reaction. This explains why the time to break down starch decreases from 5 to 2 minutes at higher temperature.

However, beyond the enzyme's optimal temperature (around 40°C), the enzyme's structure begins to denature due to heat. At 60°C, the enzyme's tertiary structure is compromised, leading to a significant loss of activity, which is evidenced by the increased reaction time of 10 minutes. The initial increase in activity followed by a decline highlights the importance of enzyme stability and the concept of an optimal temperature.
