Sample Mole Ratios Pogil Packet Answers

Below are detailed answers to common questions encountered in mole ratios activities.

Example 1: Calculating Moles of Product

Question: If 4.0 grams of hydrogen gas (H₂) reacts with excess nitrogen gas (N₂), how many moles of ammonia (NH₃) are produced?

Solution:

- Convert grams of H₂ to moles:

$$\text{Moles of H}_2 = \frac{4.0 \text{ g}}{2.016 \text{ g/mol}} \approx 1.98 \text{ mol}$$

- Use mole ratio from the balanced equation:

$$\text{Moles of NH}_3 = 1.98 \text{ mol H}_2 \times \frac{2 \text{ mol NH}_3}{3 \text{ mol H}_2} \approx 1.32 \text{ mol NH}_3$$

Answer: Approximately 1.32 moles of ammonia are produced.

Example 2: Determining Limiting Reactant

Question: Given 10 grams of N₂ and 5 grams of H₂, which reactant is limiting in the production of NH₃?

Solution:

- Convert masses to moles:

- N₂:

$$\left[\frac{10, \text{g}}{28.014, \text{g/mol}} \approx 0.357, \text{mol} \right]$$

- H₂:

$$\left[\frac{5, \text{g}}{2.016, \text{g/mol}} \approx 2.48, \text{mol} \right]$$

- Calculate the required H₂ for the available N₂:

$$\left[0.357, \text{mol N}_2 \times \frac{3, \text{mol H}_2}{1, \text{mol N}_2} = 1.07, \text{mol H}_2 \right]$$

- Since 2.48 mol H₂ are available but only 1.07 mol are needed, N₂ is the limiting reactant because H₂ is in excess.

Answer: N₂ is the limiting reactant.

What Are Mole Ratios? An Essential Foundation in Chemistry

Definition and Significance

Mole ratios are numerical relationships between the amounts of reactants and products in a balanced chemical equation. Expressed as ratios, they allow chemists to determine the proportions of substances involved in a chemical reaction. These ratios are crucial because they facilitate the conversion between different quantities—such as moles, grams, or molecules—enabling accurate calculations in laboratory and industrial settings.

For example, consider the balanced reaction:

From this, the mole ratio of hydrogen to oxygen is 2:1, and hydrogen to water is 2:2 (or 1:1). These

ratios serve as conversion factors, making it possible to predict how much of one substance will react or be produced based on the amount of another.

Why Are Mole Ratios Important?

- Predicting Reaction Outcomes: They help determine the amount of products formed or reactants consumed.
- Determining Limiting Reactants: Mole ratios enable the identification of the limiting reagent? the reactant that runs out first, limiting the extent of reaction.
- Calculating Theoretical Yields: They are fundamental in estimating the maximum amount of product achievable.
- Converting Units: Mole ratios facilitate conversions between grams, molecules, and moles, essential for laboratory calculations.

Deciphering the Answers: A Guide to Mole Ratios Pogil Packet Solutions

Providing answers to Pogil packets is not merely about giving solutions but about understanding the reasoning behind each step. Here, we explore typical questions and their detailed solutions to illustrate how students can approach mole ratio problems effectively.

Sample Problem 1: Using Mole Ratios to Find Unknown Quantities

Question:

Given the balanced chemical equation:

If 4 moles of hydrogen gas (H_2) are available, how many moles of ammonia (NH_3) can be produced?

Solution Approach:

- Identify the Mole Ratio:

From the balanced equation, the mole ratio of H_2 to NH_3 is 3:2.

- Set Up the Conversion:

Using the ratio, the number of moles of NH_3 produced is:

$$(4 \text{ mol H}_2) \times (2 \text{ mol NH}_3 / 3 \text{ mol H}_2) = ?$$

- Calculate:

$$(4 \times 2) / 3 = 8 / 3 = 2.67 \text{ mol NH}_3$$

Answer:

Approximately 2.67 moles of ammonia can be produced from 4 moles of hydrogen gas.

Sample Problem 2: Determining Limiting Reactant with Mole Ratios

Question:

In the reaction:

If you have 5 moles of ethane (C_2H_6) and 20 moles of oxygen (O_2), which reactant is limiting?

Solution Approach:

- Calculate the required amount of O_2 for 5 mol C_2H_6 :

From the balanced equation, 2 mol C_2H_6 require 7 mol O_2 .

So, for 5 mol C_2H_6 :

$$(5 \text{ mol C}_2\text{H}_6) \times (7 \text{ mol O}_2 / 2 \text{ mol C}_2\text{H}_6) = 17.5 \text{ mol O}_2$$

- Compare with available O_2 :

Available O_2 = 20 mol

Required O_2 = 17.5 mol

Since 20 mol > 17.5 mol, oxygen is in excess, and ethane is the limiting reactant.

Conclusion:

Ethane (C_2H_6) is the limiting reactant; oxygen is in excess.

Sample Problem 3: Calculating Theoretical Yield Using Mole Ratios

Question:

Using the same reaction as above, if 3 moles of ethane are reacted completely, what is the maximum amount of carbon dioxide (CO_2) produced?

Solution Approach:

- Identify Mole Ratio:

2 mol C_2H_6 produce 4 mol CO_2 .

- Set Up Calculation:

$(3 \text{ mol } C_2H_6) \times (4 \text{ mol } CO_2 / 2 \text{ mol } C_2H_6) = ?$

- Calculate:

$(3 \times 4) / 2 = 12 / 2 = 6 \text{ mol } CO_2$

Answer:

A maximum of 6 moles of CO_2 can be produced.

Common Types of Mole Conversions

Mass to Moles and Moles to Mass

These conversions are fundamental when working with chemical formulas and reactions.

Mass to Moles

To convert grams to moles:

- Identify the molar mass (g/mol) of the substance from the periodic table.

- Divide the given mass by the molar mass:

$$\text{moles} = \text{mass (g)} / \text{molar mass (g/mol)}$$

Moles to Mass

To convert moles to grams:

- Use the molar mass of the substance.
- Multiply the number of moles by the molar mass:

$$\text{mass (g)} = \text{moles} \times \text{molar mass (g/mol)}$$

Particles to Moles and Moles to Particles

Converting between particles and moles involves Avogadro's number.

Particles to Moles

- Count the number of particles.
- Divide by Avogadro's number:

$$\text{moles} = \text{particles} / 6.022 \times 10^{23}$$

Moles to Particles

- Multiply the number of moles by Avogadro's number:

$$\text{particles} = \text{moles} \times 6.022 \times 10^{23}$$

Volume to Moles and Moles to Volume (Gas Laws)

Assuming ideal gas behavior, volume conversions are based on molar volume at standard temperature and pressure (STP).

Volume to Moles

- Identify the volume in liters.
- Use the molar volume at STP: 1 mol = 22.4 L.
- Calculate moles:

$$\text{moles} = \text{volume (L)} / 22.4 \text{ L/mol}$$

Moles to Volume

- Multiply moles by 22.4 L/mol:

$$\text{volume (L)} = \text{moles} \times 22.4 \text{ L/mol}$$

Chemical Formulas and Molar Mass

Chemical formulas denote the types and numbers of atoms in a compound (e.g., H_2O , CO_2). Molar mass, expressed in grams per mole (g/mol), is calculated by summing the atomic masses of all atoms in the formula. For example, the molar mass of H_2O is approximately 18.02 g/mol (2×1.008 for H + 16.00 for O).

Detailed Breakdown of Key Exercises and Answers

1. Calculating Moles from Mass

Problem Example:

What is the number of moles in 36 grams of water (H_2O)?

Detailed Explanation:

The first step is to find the molar mass of water:

- Hydrogen (H): approximately 1.008 g/mol
- Oxygen (O): approximately 16.00 g/mol

Molar mass of H_2O = $(2 \times 1.008) + 16.00 = 18.016$ g/mol

Next, apply the formula:

$$n = \frac{m}{M}$$

$$\text{Moles} = \frac{\text{Mass}}{\text{Molar mass}}$$

]

[

$$\text{Moles} = \frac{36 \text{ g}}{18.016 \text{ g/mol}} \approx 2 \text{ moles}$$

]

Answer:

Approximately 2 moles of water.

2. Converting Moles to Particles (Atoms or Molecules)

Problem Example:

How many molecules are in 3 moles of carbon dioxide (CO₂)?

- Chlorine (Cl): approximately 35.45 g/mol

Molar mass:

\[

$$22.99 + 35.45 = 58.44 \, \text{g/mol}$$

\]

Answer:

The molar mass of NaCl is 58.44 g/mol.

4. Mole Ratios in Chemical Reactions

Problem Example:

In the reaction $2 \text{H}_2 + \text{O}_2 \rightarrow 2 \text{H}_2\text{O}$, how many grams of hydrogen are needed to produce 36 grams of water?

\[

$$\text{Moles of H}_2\text{O} = \frac{36 \, \text{g}}{18.016 \, \text{g/mol}} \approx 2 \, \text{moles}$$

\]

- Use the mole ratio from the balanced equation:

Explanation:

- Assume a 100 g sample:

- Carbon: 40 g
- Hydrogen: 6.7 g
- Oxygen: 53.3 g

- Convert to moles:

- C: $40 \text{ g} / 12.01 \text{ g/mol} \approx 3.33 \text{ mol}$
- H: $6.7 \text{ g} / 1.008 \text{ g/mol} \approx 6.65 \text{ mol}$
- O: $53.3 \text{ g} / 16.00 \text{ g/mol} \approx 3.33 \text{ mol}$
