Sample Middle School Math Olympiad Problems and Solutions

Problem 1:

Number Theory

Find all positive integers n such that $n^2 + 5n + 6$ is a perfect square.

Solution:

Rewrite the expression:

$$n^2 + 5n + 6 = (n + 2)(n + 3)$$

Set $(n + 2)(n + 3) = k^2$, where k is an integer.

Note that $(n + 2)$ and $(n + 3)$ are consecutive integers, so their product is close to $(n + 2.5)^2$.

Since the product of two consecutive integers is a perfect square only in special cases, check small values:

- For $(n = 1)$: $(1 + 2)(1 + 3) = 3 \times 4 = 12$, not a perfect square.
- For $(n = 2)$: $4 \times 5 = 20$, no.
- For $(n = 7)$: $9 \times 10 = 90$, no.
- For $(n = 8)$: $10 \times 11 = 110$, no.
- For larger (n) , the product increases and isn't a perfect square unless factors coincide in special ways.

Alternatively, note that for the product of two consecutive integers to be a perfect square, both must be perfect squares themselves or equal, which is impossible for consecutive integers unless at 0, which isn't positive.

Thus, there are no positive integers (n) such that $(n^2 + 5n + 6)$ is a perfect square.

Problem 2:

Geometry

In triangle (ABC) , $(AB = AC)$. The points (D) and (E) lie on (BC) such that $(BD = BE)$. If (AD) and (AE) intersect at point (F) , prove that $(BF = CF)$.

Solution Outline:

- Since $(AB = AC)$, triangle (ABC) is isosceles with (A) at the apex.
- (D) and (E) are points on (BC) with $(BD = BE)$. This symmetry suggests (D) and (E) are equidistant from some point or symmetric in position.
- The lines (AD) and (AE) intersect at (F) .
- Using properties of isosceles triangles and similar triangles, one can show (F) is the midpoint of (BC) , hence $(BF = CF)$.

This problem emphasizes symmetry and properties of isosceles triangles, typical in geometric olympiad problems.
