- Define your model class:

```
use CodeIgniter\Model;
```

```
class UserModel extends Model
```

```
{
```

```
protected $table = 'users';
```

```
protected $primaryKey = 'id';
```

```
protected $allowedFields = ['name', 'email', 'password'];
```

```
}
```

Connecting to the Database

Edit **app/Config/Database.php** to set your database credentials and ensure your database (e.g., MySQL) is running.

Performing CRUD Operations

- Create: **insert()**
- Read: **find()**, **findAll()**
- Update: **update()**
- Delete: **delete()**

- Limited built-in tools for advanced features

Why Choose CodeIgniter?

For developers who want to learn PHP frameworks quickly and efficiently, CodeIgniter offers an ideal starting point. Its straightforward approach enables you to understand core web development concepts without the overhead of complex configurations.

Getting Started with CodeIgniter

Prerequisites

Before diving into CodeIgniter, ensure you have the following:

- PHP version 7.2 or higher installed on your system
- Web server like Apache or Nginx
- Database server such as MySQL
- Basic knowledge of PHP and HTML

Installation

- Download CodeIgniter: Visit the official website (<https://codeigniter.com/>) and download the latest version.
- Extract Files: Unzip the package into your web server's root directory.
- Configure Base URL: Edit the ``application/config/config.php`` file to set your base URL.
- Set Up Database: Create a database and configure database connection settings in ``application/config/database.php``.

Once installed, you can access the default welcome page by navigating to your local server URL.

Understanding the MVC Architecture in CodeIgniter

Model

The Model handles data operations, such as retrieving data from a database or processing user input.

View

The View manages the presentation layer, displaying information to the user.

Controller

The Controller acts as an intermediary, processing user requests, interacting with models, and loading views.

How MVC Works in CodeIgniter

When a user requests a page:

- The URL is routed to a specific Controller
- The Controller interacts with Models to fetch data
- The Controller loads the corresponding View, passing data to it
- The View renders the final HTML sent to the browser

Benefits of MVC:

- Separation of concerns
- Easier maintenance and scalability
- Reusability of components

Basic Concepts and Workflow

Routing

Routing determines how URLs map to controllers. In CodeIgniter, the `routes.php` file defines custom URL patterns.

Example:

```
```php
$route['products'] = 'shop/products';
```
```

Controllers

Create controllers in `application/controllers/`. For example, a simple `Welcome.php` controller:

```
```php
defined('BASEPATH') OR exit('No direct script access allowed');

class Welcome extends CI_Controller {

 public function index() {

 $this->load->view('welcome_message');
 }
}
```

```
}
```

```
}
```

```
?>
```

```
...
```

## Views

Create HTML templates in ``application/views/``. For example:

```
```php
```

Welcome to CodeIgniter!

```
...
```

Models

Models interact with the database. Example:

```
```php
```

```
class Product_model extends CI_Model {
```

```
public function get_products() {
```

```
return $this->db->get('products')->result();
```

```
}
```

```
}
```

```
?>
```

```
...
```

## Working with Databases

### Connecting to the Database

Configure your database settings in `application/config/database.php`.

## Performing CRUD Operations

CodeIgniter's Active Record class simplifies database interactions:

- Create:

```
```php
$this->db->insert('products', $data);
```
```

- Read:

```
```php
$this->db->get('products')->result();
```
```

- Update:

```
```php
$this->db->where('id', $id);

$this->db->update('products', $data);
```
```

- Delete:

```
```php
$this->db->where('id', $id);
```

```
$this->db->delete('products');
```

```
...
```

Adding Functionality and Enhancing Your App

Form Handling

CodeIgniter provides form helper functions to create and validate forms easily.

Example:

```
```php
```

```
$this->load->helper('form');
```

```
echo form_open('submit');
```

```
echo form_input('name');
```

```
echo form_submit('submit', 'Send');
```

```
echo form_close();
```

```
...
```

### Validation

Use the Form Validation library:

```
```php
```

```
$this->load->library('form_validation');
```

```
$this->form_validation->set_rules('name', 'Name', 'required');
```

```
if ($this->form_validation->run() == FALSE) {
```

```
// Load form again
```

```
} else {
```

```
// Process data
```

```
}
```

```
...
```

Sessions and Authentication

Manage user sessions with the Session library to implement login/logout features.
